SWAC-1 Environmental Data Report

Introduction

In undersea warfare, the shallow water environment has become a high priority area of interest for the U.S. Navy. The Shallow Water Active Classification (SWAC) 6.2 program is a joint effort sponsored by the Technology Directorate of the Office of Naval Research (ONR 321) and SACLANT Centre with a series of tests aimed at addressing shallow water problems. The SWAC-1 test was conducted in the Strait of Sicily on the Malta Bank (fig.1) during October 20 to November 10, 1994. This report documents the data collected on this test and provides a ready means of data access.

Figure 1. SWAC-1 site (NUWC-NPT TM 951004, 1995).

Data Collected

The test involved three surface platforms; the R/V Alliance, the NAWC-38 and the USS Grapple. They were utilized to collect environmental data during three test phases; a pretest phase from October 20 to 22 designed to obtain a-priori environmental data, phase 1 from October 23 to November 4 and phase 2 from November 5 to November 10.

During the pre-test, SWATĤ bathymetry data was collected, bottom sediments were sampled to evaluate sediment parameters (grain size, layering and sediment sound speed), an Acoustic Doppler Current Profiler (ADCP) and a mooring with two current meters was used to measure currents, XBT probes were used to measure water temperature profiles, and CTD data was collected to obtain salinities for sound speed computation. During the phase 1, Alliance collected XBT data and NAWC-38 deployed a InterOcean current meter/CTD. The USS Grapple did not participate during most of this phase. From 1 to 10 November which includes part of phase 1 and all of phase 2, all three platforms participated. During this time, Alliance dropped XBTs, NAWC-38 deployed its current meter/CTD and USS Grapple collected CTD casts, XBT casts, thermistor chain data from a MET-Ocean CMOD TZ experimental buoy, weather data from a moored Wind Direction and Speed (WDS) buoy and current meter data from the WDS mooring. The data

collected are listed in Table 1. All times are GMT times throughout this data report.

| CTD | | 18 | 58 | |
| Meteorology | | | Ship Log | 9 days |
| Currents | ADCP | 18 | | 11 days |
| Thermistor | | | 7 days | |

Geology

Bottom-sediment grab-samples were collected using a Shipek Bottom Sampler to help define bottom-type changes. The sampler's design prevents sediment washout during retrieval and gives a good representation of the bottom sediments. Fig. 2 is a Shepard diagram showing the distribution of sediment size by percent of sand, silt, and clay for each of the 18 bottom samples. Above this plot is a listing of applicable parameters used in compiling geoacoustic models for the test area. Sediment sound speed at the water-sediment interface (0.0-m depth) is determined by multiplying the applicable in situ bottom water sound speed (Vw) times the relative sediment sound speed (Vo). Sediment samples were collected at the sites shown in fig. 3. Sediment size analysis results on the sediment samples are listed in Appendix A (Kekko et al, 1995).

Fig. 2 Shepard diagram with sediment samples plotted and geoacoustic parameters.

Figure 3. Locations and descriptions of bottom samples.

Meteorological Data Collected

R/V Alliance automatically logged wind speed and direction with its navigation and depth log at five minute intervals. This data is available in the Quicklook Report (NUWC-NPT TM 951004, 1995). Shipboard 4-hour weather observations were recorded on the USS Grapple for 30 October to 9 November. Wind speed, direction, barometric pressure, and air and sea surface temperature were measured by the WSD buoy from 31 October to 8 November. Plots of this data are presented in fig. 4 through fig. 8. USS Grapple and WSD buoy data are listed in Appendix B as are copies of the weather plots provided by the Navy meteorologists aboard the USS Grapple.

Figure 4 .Wind speed recorded by (a) Wind speed recorded by WSD buoy 1 Nov. to 9 Nov and (b) USS Grapple 30 Oct. to 8 Nov.

Figure 5. Wave height recorded by USS Grapple 30 Oct. to 8 Nov. 1994.

Figure 6. (a) Wind direction recorded by USS Grapple 29 Oct. to 8 Nov. and (b) Wind direction recorded by WSD buoy 1 Nov. to 9 Nov.

Figure 7. Barometric pressure recorded by the WSD buoy 1 Nov. to 9 Nov.

Figure 8. Sea surface temperature recorded by the WSD buoy 1 Nov. to 9 Nov.

Ocean Currents

ADCP data was collected during two days of the pre-test data collection (Oct. 19 to Oct. 21) on R/V Alliance and does indicate surface currents flowing to the south-southeast. The data is not included in the quicklook report and was not included in any data package but might be available from the SACLANT Centre. Two InterOcean current meters (Table 2) were also deployed in approximately 129 m of water at 36°31.9' N 014° 56.1' E. Current speeds were on the order of 10 cm/sec at depths of 87 meters but the direction of flow was towards the northwest to northeast superimposed on tidal oscillations. On October 31, the weather buoy with a current meter attached at 71 m water depth was deployed at 36°32.1 N, 014°50.6'E in approximately 108 meters of water. Plots of the moored current meter data are presented in fig 9 through figure 10. The moored current meter data is tabulated in Appendix C.

Figure 9. current speed and direction at depth indicated for 19-21 October, 1994.

Figure 10. Current Speed and Direction near USS Grapple location 31 October to 9 November 1994.

Table 2. S4 InterOcean S-4 current meter Specifications

| Speed | Resolution: 0.2 cm/s | Range:0-350 cm/s |
|-----------|----------------------|--------------------|
| Direction | Resolution:0.5° | Range:0-360° |
| Depth | Resolution:0.1% fs | Range:0-1,000 dBar |

Oceanographic Water Column Data

The oceanographic data collected consisted of expendable bathythermograph (XBT) profiles, and conductivity-depth-temperature (CTD) profiles. The XBTs used were Sippican T10 and T11 probes, while the CTD used aboard the USS Grapple was a SeaBird SBE-25 while the NAWC-38 utilized a InterOcean S4 current meter augmented with CTD sensors (Tables 3 and 4). Both the downcast and upcast CTD data were recorded. The positions of cast data collected by all vessels are shown in fig. 11. Dates with associated runs for all casts are summarized in Table 5. All profiles were corrected for near surface temperature using bucket temperatures, edited for spikes, interpolated to 1 m depths and decimated to selected standard depths for analysis and display. Sound speeds were computed using Wilson's (1960) equation. Individual profiles are listed with sound speeds plotted in Appendix D. The plots in this appendix are from the one meter depth interval data whereas the data listings are only given at standard depths. This is done so that smaller features smoothed over by the standard depths can be observed in the plots.

Table 3. XBT Specifications

| PROBE TYPE: | T-10 | T-11 |

TZ buoy Operations/Data Collected

The thermistor chain was a METOCEAN Data Systems LTD Compact Meteorological and Oceanographic Drifting (CMOD) temperature/depth (TZ designation) experimental buoy. Although designed as an air-deployable, free drifting buoy radio linked to a satellite, it was tethered to the USS Grapple utilizing a Telonics radio to receive buoy transmissions. It operated well in high seas and currents; however, a comparison with CTD data indicates that the TZ thermistors were at a shallower depth than their position along a vertical cable would place them. The small weight attached to the bottom of the thermistor wire was probably insufficient to keep the thermistor cable from oscillating with changes in current speed. Because the depth of each individual thermistor can not be ascertained, it is not possible to isolate temporal changes in temperature from changes due to depth fluctuations in the thermistor. For this reason the TZ data will not be reported.

Acknowledgments

The tasking support provided by Dr. Tommy Goldsberry (Program Manager) and Mr. Kenneth Dial of the Ocean, Atmosphere and Space Science and Technology Department (Code 321) of the Office of Naval Research (ONR), under Program Element 0603747N, Research Project R2187 is greatly appreciated. The Author thanks Mr. Joseph Monti and William Comeau for all their assistance throughout the sea test and post test phases.
